

STAT 7500 – Statistical Programming

Homework #1

Submission instructions: For this HW, make sure to include the code, the output, or the log window as requested in each part (do not include more than I request). Make sure to label each problem/part clearly so that the document is easy to follow. At the end of the document, include an “Appendix” where you copy and paste your entire SAS code (editor window) for the assignment. Once you complete the HW, you can submit it on Blackboard in the corresponding assignment.

Note: this homework can be completed by referencing the lecture slides and .sas program used in class (i.e., AI shouldn’t be necessary). Recall the course AI policy and be sure to cite it if you use it.

Problem 1

- a) Open SAS and enter the following code in the editor window, exactly as written.

```
data my_first_data;  
  input name $ id;  
  mydatalines;  
Manish 577  
Arlene 499  
Dzvinka 140  
;  
run;
```

Run the code above and check the log window for errors. State what error was found.

- b) Fix the code and verify that it runs correctly. Provide the corrected code, and comment on what you fixed.
- c) Run a PROC PRINT to see the dataset that you created. Please include a printout of the data.

Problem 2

Consider the following program:

```
data class_scores;  
instagram name test1 test2 test3 final  
cards;  
Alexandra 80 85 75 90  
Greta 85 85 90 90  
Harry 75 85 95 85  
Marshall 100 90 95 100  
run;
```

```
proc print data=class_scores;  
run;
```

- a) Type in the program above and fix all of the mistakes. Do not worry if the output is not ideal (for example, if a name is partially cut-off). **Include your final code only. Please highlight the parts of the corrected code that you fixed or briefly list them out.**
- b) Change the fixed-up program from part a as follows, and **include your final code and output:**
 - a. Add the following last names for the individuals, respectively: May, Carlsen, Romano, and Wasserstein.
 - b. Make it so that the name variable includes each individual's entire first and last name, with a space between them.
 - c. Print the data set. Include a title and drop the observation numbers in the output.
 - d. Label the column headings "Test 1", "Test 2", "Test 3", and "Final Test".
