

STAT 7500 – Statistical Programming

SAS Homework 04

Submission instructions: same as previous weeks. Multiple formats are okay, so long as it is organized / well labeled.

This week, you will be working with the Phillies_2025.xlsx dataset. Much of the data cleaning was done together in class.

Assigned Problems

1. (A lot of this is done in class) Conduct necessary cleaning steps to get the Phillies_2025.xlsx data in the form shown below (will have 28 obs, 10 shown here)

Obs	JerseyNumber	FirstName	LastName	position	batting	throwing	Ht	total_inches	Wt	DOB	age
1	10	J.T.	Realmuto	Catcher	R	R	6' 0"	72	212	03/18/1991	34
2	12	Kyle	Schwarber	Outfielder	L	R	5' 11"	71	229	03/05/1993	32
3	13	Rafael	Marchán	Catcher	S	R	5' 9"	69	170	02/25/1999	26
4	16	Brandon	Marsh	Outfielder	L	R	6' 2"	74	215	12/18/1997	27
5	17	Max	Kepler	Outfielder	L	L	6' 4"	76	225	02/10/1993	32
6	18	Donovan	Walton	Infielder	L	R	5' 10"	70	190	05/25/1994	31
7	19	Rafael	Lantigua	Infielder	R	R	5' 7"	67	153	04/28/1998	27
8	2	Harrison	Bader	Outfielder	R	R	5' 11"	71	210	06/03/1994	31
9	21	Garrett	Stubbs	Catcher	L	R	5' 10"	70	170	05/26/1993	32
10	25	Matt	Strahm	Pitcher	R	L	6' 2"	74	190	11/12/1991	33

2. Create a new dataset with only players whose last name starts with “S”. Print this data, with an appropriate title.
3. With cleaned data created in (1), create 4 clean datasets – one for each position – from a single data step. *[Note, this is just for practice, you won’t use these in the remaining analysis]*
4. *[Back to data with all players]* Convert FirstName and LastName to all uppercase letters. Print the first 5 rows of these columns to demonstrate they have been converted.
5. Find the oldest and youngest players for each position *(using the dataset with all players)*. Print out these results (should be 8 players total) and comment on anything you notice.
6. Calculate average age, height, and weight by position. Comment on the results.
7. Produce a frequency table for batting x throwing. Comment on the results.
